

SELF-CHARGEABLE BATTERY ENERGY IN GENERATING STATIONS

CROSS-REFERENCES TO RELATED APPLICATIONS

New CIP of Prior Ser. No. 08/980,485 on 02/28/97 now pending

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention refers to energy and specifically to self-made energy, i.e., regarding generating stations and substations including bridges with self-made energy. As the bridges comprise **SELF-MADE ENERGY (SME)**, their lights are to illuminate the bridges continuously, thereby a system as set forth in my prior **UNITED STATES Patent Number:**

Further, two several hundred ton batteries enclosed via conventional battery chargers, as set forth in my prior **U.S. Patent**, charges one another, so, as to, continually generate electric energy. The **SME** system will replace all heretofore electrical equipment and will continually deliver electrical energy to associated systems, however for one hundred years.

X Department of Energy (General Provisions) (Parts 1000 1099), and XXXI Office of Environmental Quality with respect to the Department of Agriculture (Parts 3100 3199) by way of **CFR**, thus will regulate, and control **SELF-CHARGEABLE ENERGY. S.C.B. (SELF-CHARGEABLE BATTERIES)**, thus will save thousands of dollars yearly, in maintenance cost for US organizations. While safety, and environmental concerns each of which is an important issue, a **S.C.B. Electrically Powered Locomotive** is to provide **basic Self-Chargeable energy** concerning its load. **On earth, only one nation will be generating Giant Self-made Energy Systems; namely, THE UNITED STATES OF AMERICA.**

Description of the Prior Art

SELF-CHARGEABLE ENERGY is a revolutionary 21st. Century reality, so, **AMERICANS** do not have to depend upon mechanical energy being changed into electrical energy by water, steam, gas, oil, gasoline including petroleum. **SELF-MADE ENERGY** is

a dominating power from (GOD), thus, presented to applicant, as a gift such that he will teach it under the provisions of the Code of Federal Regulations.

SUMMARY OF THE INVENTION

Accordingly, one object of this present invention is to provide self-made energy with respect to structures, such as **Generating Stations, Bridges, also Self-made Energy Operated Phones**, which turn on lights for illuminating these bridges, and even **Airports** about **self-made energy** operated equipment.

However, to accomplish the foregoing and other objects, a self-made energy system for generating stations concerning power comprises: a charging system defining two batteries in such system, a first battery to fit a first charger, whereby a second battery is sized to befit a second charger, a first DC-AC converter and a first plug to befit a first receptacle on the first charger, a second DC-AC converter, and a second plug in a second receptacle upon the second charger and ways for the batteries to load each other, a first AC adaptor and a third plug to fit a first jack upon the first charger, so, the adaptor is to fit a socket via the second converter, the second charger comprises a way for outputting AC current for charging the first battery, a second AC adaptor and a fourth plug so as to fit a second jack about the second charger, as the adaptor is to befit a socket on the first converter, the first charger comprises ways to output current to charge the second battery, circuit breaker systems for interrupting the batteries regarding power via obstructing two circuits. The charging system has two pairs of LEDs to indicate low charge thereby, the breaker systems are to close the circuits. The batteries having a fifth to sixth LED to show full, whereby, the circuits comprise a way for being opened. The batteries connected via series, and ways thereby to operate, a seventh and eight LED have a way to emit light. The charging system is to connect to a generator whereby the batteries have ways

to work as the generator is off. The batteries thereby have nonmetallic electric conductors, one solvent to dissolve and a ninth LED on power. The batteries have a transmitter, and ways to be refilled, whereby, the ninth LED is to emit light at one hundred years.

According to another merit regarding the new invention, a self-chargeable battery machine comprises charging systems which have two batteries, such that the batteries are to fit in conventional chargers, DC-AC converters for converting DC current to alternating current regarding two converters, one first, and second AC adaptor including ways for charging the batteries by the converters, a generating station system for producing self-made energy, illumination systems for thereby illuminating the batteries having spiraled light fixtures so as to enclose lamps, an authorized person defines a scooter, and a way for replacing the lamps, elevators for maintenance thereof receptacles and plugs, and a way for plugging in the converters. The batteries thereby, include ways to load one another, an adjacent bridge having self-chargeable batteries also. The bridge has bases whereby on each side of a river, the bases comprise the self-chargeable batteries, thereinto. The bridge having lamps and a way to thereby illuminate, the batteries have ways to illuminate the bridge. The batteries thereby, include structures, a main control center comprises feeders, branch circuits and a system ground. The lamps via the bridge comprises ways to be turned on by way of a timer, conventionally. The main control center, thereby, comprises branch control centers, and ways to send Self-Made Energy to various parts of a City.
